1 Problem

Consider the vector space P_n of real polynomials in x of degree less than or equal to n. Define $T : P_2 \to P_3$ by $(Tf)(x) = \int_0^x f(t)dt + f'(x)$.Then the matrix representation of T with respect to the bases $1, x, x^2$ and $1, x, x^2, x^3$ is

1.$\begin{bmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & \frac{1}{2} & 0 \\ 0 & 2 & 0 & \frac{1}{3} \end{bmatrix}$ 2.$\begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 2 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & \frac{1}{3} \end{bmatrix}$

3.$\begin{bmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 2 & 0 \\ 0 & \frac{1}{2} & 0 & \frac{1}{3} \end{bmatrix}$ 4.$\begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & \frac{1}{2} \\ 0 & 2 & 0 \\ 0 & 0 & \frac{1}{3} \end{bmatrix}$

2 Explanation

Transformation matrix gives the co-ordinates of images of vectors which are mapped from domain to co-domain.

3 Solution

$1, x, x^2$ is basis for P_2 which is domain space.

$$(Tf)(x) = \int_0^x f(t)dt + f'(x) \tag{3.0.1}$$

We should the image of basis vectors of domain space in co-domain space with respect to T.
Basis vector
$\begin{bmatrix} 1 \\ x^2 \\ x^3 \end{bmatrix}$

Image of basis vector in co-domain space is given by

$$(Tf)(x) = \int_0^x f(t)dt + f'(x) \tag{3.0.2}$$

$$(Tf)(x) = \int_0^x 1 + t + t^2 dt + 1 + 2x \tag{3.0.3}$$

$$(Tf)(x) = t + \frac{t^2}{2} + \frac{t^3}{3}\Big|_0^x + 1 + 2x \tag{3.0.4}$$

$$(Tf)(x) = 3x + \frac{x^3}{3} + \frac{x^2}{2} + 1 \tag{3.0.5}$$

It can be written as

(Tf)(x)=1+3x+x$^2(\frac{1}{2}) + x^3(\frac{1}{3})$

So coordinates of image of base vector is given by

So coordinates of $T(1)$ with respect to co-domain basis are$\begin{bmatrix} 1 \\ 3 \\ \frac{1}{2} \\ \frac{1}{3} \end{bmatrix}$ Co ordinates of basis vectors in domain space are $\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$

Among the given options matrix which maps coordinates of basis vector from domain space to co-domain space is

$[T]$=$\begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 2 \\ 0 & \frac{1}{2} & 0 \\ 0 & 0 & \frac{1}{3} \end{bmatrix}$
